puff traffic offer  
after loft raft often

In the case of 'ff' the cross stroke is drawn immediately after the ff.  
In the case of 'ft' the cross stroke is drawn when the word is written - the next letter is joined from the 't'

eg. often often  
but lraff lraffi traffic

23. C is the only capital letter which is joined to lower case letters

Name: \_\_\_\_\_  
Date: \_\_\_\_\_  
Subject: Year 2 Literacy  
Unit: Handwriting

Write over the words then write them yourself on the line below.

1. Sometimes I will take the bus to school.
2. I was nervous about my trip to the dentist.
3. The firefighters were working in the house.
4. The football team ran out onto the pitch.
5. There was a lot of people there when we arrived after supper.
6. David wanted a computer game for his birthday.
7. The teacher was angry for the missing bag.
8. I had to read 2 pages of my book for homework.

Loopy Letter b

Name: \_\_\_\_\_

Loopy Letters: e l h k b f j

Note: Loopy letters are based on the pattern used to form the letter e.

Trace the steps to making the Loopy letter b on the following line.

*b b b b b b b*

Trace the Loopy letter b's. Finish the line with Loopy letter b's.

*b b b*

Make a Loopy Letter word! Trace the Loopy Letters to make a word.

*bell bell bell bell*

Trace the Loopy Letter word. Finish the line by repeating the word.

*bell*

Make a word! Trace the letters to make a word.

*cab cab cab cab*

Trace the word. Finish the line by repeating the word.

*cab*

Joint handwriting practice sheets.

Should an elevated strep titer be treated with antibiotics? The symptoms of OCD or tic symptoms suddenly become worse following a strep infection. Researchers at NIMH have been investigating the use of antibiotics as a form of prophylaxis to prevent future problems. An elevated anti-strep titer means the child has had a strep infection sometime within the past few months, and his or her body created antibodies to fight the strep bacteria. Learn more about mental health medications. How can you manage neuropsychiatric symptoms of PANDAS? The goal of clinical trials is to determine if a new test or treatment works and is safe. NIMH will not provide specific medical advice and urges you to consult with a qualified mental health or health care provider for diagnosis and answers to your personal questions. Children may have "positive" titers for many months after one infection. No. Many children have OCD, tics, or both, and almost all school-aged children get strep throat at some point. The test measures a normal, healthy response—the production of antibodies to fight off an infection. Studies at the National Institute of Mental Health (NIMH) and elsewhere have shown that some cross-reactive antibodies target the brain—causing OCD, tics, and the other neuropsychiatric symptoms of PANDAS. Because these elevated titers are merely a marker of a prior infection and not proof of an ongoing infection, it is not appropriate to give antibiotics for elevated titers. Children with PANDAS seem to have dramatic ups and downs in the severity of their OCD and tics. OCD symptoms are treated best with a combination of CBT and a selective serotonin reuptake inhibitor (SSRI) medication, and tics respond to a variety of medications. Children with PANDAS-related obsessive-compulsive symptoms will benefit from standard medications; behavioral therapies, such as cognitive behavioral therapy (CBT); or both. My child has PANDAS. Behavioral Health Treatment Services Locator The Substance Abuse and Mental Health Services Administration provides this online resource for locating mental health treatment facilities and programs. Find a facility in your state, or see our additional resources. Children with PANDAS often experience one or more of the following symptoms in conjunction with their OCD or tic disorder: Symptoms of attention-deficit/hyperactivity disorder (ADHD), such as hyperactivity, inattention, or fidgeting Separation anxiety (e.g., child is "clingy" and has difficulty separating from his or her caregivers; for example, the child may not want to be in a different room in the house from his or her parents) Mood changes, such as irritability, sadness, or emotional lability (i.e., tendency to laugh or cry unexpectedly at what might seem the wrong moment) Trouble sleeping Nighttime bed-wetting, frequent daytime urination, or both Changes in motor skills, such as changes in handwriting Joint pains What is an episodic course of symptoms? PANDAS is short for Pediatric Autoimmune Neuropsychiatric Disorders Associated with Streptococcal Infections. The increased symptom severity usually persists for at least several weeks but may last for several months or longer. If PANDAS symptoms worsen, the SSRI dosage should be decreased promptly. Although individual participants may benefit from being part of a clinical trial, participants should be aware that the primary purpose of a clinical trial is to gain new scientific knowledge so that others may be better helped in the future. Should he have his tonsils removed? Other labs set the upper limit at 150 or 200. If strep is found in conjunction with two or three episodes of OCD, tics, or both, then the child may have PANDAS. What about treating PANDAS with plasma exchange or immunoglobulin (IVIG)? Is this bad for my child? Yes. NIMH website www.nimh.nih.gov MedlinePlus (National Library of Medicine) (En español: ClinicalTrials.gov www.clinicaltrials.gov www.clinicaltrials.gov (En español: National Institute of Mental Health Office of Science Policy, Planning, and Communications Science Writing, Press, and Dissemination Branch 6001 Executive Boulevard Room 6200, MSC 9663 Bethesda, MD 20892-9663 Phone: 301-443-4513 or Toll-free: 866-615-6464 TTY: 301-443-8431 or TTY Toll-free: 866-415-8051 Fax: 301-443-4279 Email: nimhinfo@nih.gov Website: www.nimh.nih.gov Are there any other symptoms associated with PANDAS episodes? Because each lab measures titers in different ways, it is important to know the range used by the lab where the test was done—just ask where the lab draws the line between negative or positive titers. The height of the titer elevation doesn't matter, and elevated titers are not necessarily bad for your child. Visit the Agency for Healthcare Research and Quality website for tips. What does an elevated anti-strep antibody titer mean? To learn more about using NIMH publications, please contact the NIMH Information Resource Center at 866-615-6464, email nimhinfo@nih.gov, or refer to our reprint guidelines. When is a strep titer considered to be abnormal, or "elevated"? Questions to Ask Your Doctor Asking questions and providing information to your doctor or health care provider can improve your care. NIMH does not intend to provide specific medical advice on its websites, but rather to help visitors better understand mental health and disorders. Some children create lots of antibodies and have very high titers (up to 2,000), while others have more modest elevations. Current research does not suggest that tonsillectomies for children with PANDAS are helpful. However, there isn't enough evidence to recommend the long-term use of antibiotics at this time. My child has had strep throat before, and he has tics, OCD, or both. PANDAS is considered a pediatric disorder and typically first appears in childhood from age 3 to puberty. Thus, the treatments should be reserved for severely ill patients and administered by a qualified team of health care professionals. Contact the International OCD Foundation or the PANDAS Physicians Network to find a doctor who may be knowledgeable about PANDAS. No. Elevated titers indicate that a patient has had a past strep exposure, but the titers can't tell you precisely when the strep infection occurred. These antibodies that react to both the molecules on the strep bacteria and to similar molecules found on other parts of the body are an example of "cross-reactive" antibodies. Plasma exchange or immunoglobulin (IVIG) may be a consideration for acutely and severely affected children with PANDAS. Some children have "positive" antibody titers for many months after a single infection. However, children with PANDAS have a very sudden onset or worsening of their symptoms, followed by a slow, gradual improvement. This hiding is called "molecular mimicry" and allows the strep bacteria to evade detection for a long time. The lab at the National Institutes of Health considers strep titers between 0 and 400 to be normal. Talk to your doctor about clinical trials, their benefits and risks, and whether one is right for you. This publication is in the public domain and may be reproduced or copied without permission from NIMH. Talking with your doctor builds trust and leads to better results, quality, safety, and satisfaction. The diagnosis of PANDAS is a clinical diagnosis, which means that there are no lab tests that can diagnose PANDAS. However, the molecules on the strep bacteria are eventually recognized as foreign to the body and the child's immune system reacts to the molecules by producing antibodies. Clinical trials are research studies that look at new ways to prevent, detect, or treat diseases and conditions. Can penicillin be used to treat PANDAS or prevent future PANDAS symptom exacerbations? Many children with OCD or tics have good days and bad days, or even good weeks and bad weeks. OCD or tics that are almost always present at a relatively consistent level do not represent an episodic course. Tips for Parents or Caregivers Sterilize or replace toothbrushes during and following the antibiotics treatment to make sure that the child isn't re-infected with strep. What are the treatment options for children with PANDAS? Reactions to strep infections are rare after age 12, but researchers recognize that PANDAS could occur, though rarely, among adolescents. Treatment with Antibiotics The best treatment for acute episodes of PANDAS is to treat the strep infection causing the symptoms, if it is still present, with antibiotics. Citation of NIMH as a source is appreciated. Penicillin does not specifically treat the symptoms of PANDAS. A throat culture should be done to document the presence of strep bacteria in the throat. However, SSRIs and other medications should not be stopped abruptly, as that also could cause difficulties. Could an adult develop PANDAS? Instead, health care providers use diagnostic criteria for the diagnosis of PANDAS (see below). What if my child's doctor does not understand or does not want to consider PANDAS? The antibodies stay in the body for some time after the infection is gone, but the amount of time that the antibodies persist varies greatly between individuals. A child may be diagnosed with PANDAS when: Obsessive-compulsive disorder (OCD), tic disorder, or both suddenly appear following a streptococcal (strep) infection, such as strep throat or scarlet fever. Children with PANDAS appear to be unusually sensitive to the side effects of SSRIs and other medications, so it is important to "start low and go slow" when using these medications. Please note: NIMH does not evaluate the professional qualifications and competence of individual health care providers listed on these websites. Because of the molecular mimicry by the bacteria, the immune system reacts not only to the strep molecules but also to the human host molecules that were mimicked; antibodies "attack" the mimicked molecules in the child's own tissues. It is possible that adolescents and adults may have immune-mediated OCD, but this is not known. In fact, the average grade-school student will have two or three strep throat infections each year. If a tonsillectomy is recommended because of frequent episodes of tonsillitis, it would be useful to discuss the pros and cons of the procedure with your child's health care provider because of the role that the tonsils play in fighting strep infections. Penicillin and other antibiotics treat the sore throat caused by the strep by getting rid of the bacteria. The diagnostic criteria are: Presence of OCD, a tic disorder, or both Pediatric onset of symptoms (i.e., age 3 to puberty) Episodic course of symptom severity (see information below) Association with group A Beta-hemolytic strep infection, such as a positive throat culture for strep or history of scarlet fever Association with neurological abnormalities, such as physical hyperactivity or unusual, jerky movements that are not in the child's control Very abrupt onset or worsening of symptoms if the symptoms have been present for more than a week, blood tests may be done to document a preceding strep infection. Does that mean he has PANDAS? If the throat culture is positive, a single course of antibiotics usually will get rid of the strep infection and allow the PANDAS symptoms to subside. In addition to these symptoms, children may become moody or irritable, experience anxiety attacks, or show concerns about separating from parents or loved ones. In addition, there is a risk of infection with any invasive procedure, such as these. They hide themselves by putting molecules on their cell wall so that they look nearly identical to molecules found on the child's heart, joints, skin, and brain tissues. Although the latter infections are rare, they have been reported to trigger PANDAS symptoms in some patients and can be particularly problematic because they will linger for longer periods of time and continue to provoke the production of cross-reactive antibodies. Strep bacteria are very ancient organisms that survive in the human host by hiding from the immune system as long as possible. At the present time, the clinical features of the illness are the only means of determining whether a child might have PANDAS. Antibiotics are recommended only when a child has a positive rapid strep test or positive strep throat culture. The strep bacteria can be harder to eradicate in the sinuses and other sites, so the course of antibiotic treatment may need to be longer than that used for strep throat. If a properly obtained throat culture is negative, the clinician should make sure that the child doesn't have an occult (hidden) strep infection, such as a sinus infection (often caused by strep bacteria) or strep bacteria infecting the anus, vagina, or urethral opening of the penis. What causes PANDAS? The resources are provided for general informational purposes only. PANDAS is considered as a diagnosis when there is a very close relationship between the abrupt onset or worsening of OCD, tics, or both, and a strep infection. The symptoms are usually dramatic, happen "overnight and out of the blue," and can include motor or vocal tics or both and obsessions, compulsions, or both. We have new and better treatment options today because of what clinical trials uncovered years ago. Researchers at NIMH and around the country conduct many studies with patients and healthy volunteers. It also might be helpful to ask a health care provider to perform throat cultures on the child's family members to make sure that none are "strep carriers," who could serve as a source of the strep bacteria. In other words, clinicians should prescribe a very small starting dose of the medication and increase it slowly enough that the child experiences as few side effects as possible. Research suggests that both active treatments can improve global functioning, depression, emotional ups and downs, and obsessive-compulsive symptoms. Learn more about clinical research and how to find clinical trials being conducted around the country. The anti-strep antibody titer (i.e., the number of molecules in blood that indicate a previous infection) is a test that determines whether the child has had a previous strep infection. How is PANDAS diagnosed? It is unlikely that someone would experience these post-strep neuropsychiatric symptoms for the first time as an adult, but it has not been fully studied. However, there may be side effects associated with the treatments, including nausea, vomiting, headaches, and dizziness. Be part of tomorrow's medical breakthroughs. If children with PANDAS get another strep infection, their symptoms suddenly worsen again. In PANDAS, research suggests that it is the antibodies produced by the body in response to the strep infection that may cause PANDAS symptoms, not the bacteria itself.
