Remove bookmark from pdf online

(Image credit: Shutterstock / Valery Brozhinsky) A growing number of internet users have attempted to remove information about themselves online, but in many cases have failed to protect their privacy, new figures have shown.Four in five people (82 percent) surveyed in a major study by Kaspersky said they had tried to remove private information which had been publicly available, either from websites or social media channels, recently.However a third (37 percent) of those surveyed had no idea of how to remove details about themselves online.Kaspersky's study also found that more and more users have seen their data put at risk as consumers share more information online.The survey of more than 15,000 respondents found that over a third (34 percent) of consumers have faced incidents where their private information was accessed by someone who did not have their consent. Of these incidents, over a quarter (29 percent) resulted in financial losses and emotional distress, and more than a third (35 percent) saw someone able to gain access to personal devices without permission.This rises to 39 percent among those aged between 25 and 34, despite younger internet users often being expected to have higher levels of technological literacy. Overall, one in five people say they are concerned about the personal data that organisations are collecting about them and their loved ones.The news came shortly after a similar study reported more than half of American citizens would not to use a product or a service that might disclose their personal information. Even using a VPN may not be enough to secure your privacy online, with a recent TechRadar Pro study finding that the privacy of millions could be jeopardised by little-known information sharing treaties designed to sidestep surveillance law.Almost half (46.6 percent) of all VPN services are headquartered in countries known to participate in the Fourteen Eyes intelligence sharing pact, meaning members could use its terms to circumvent laws that prohibit the surveillance of citizens, which poses a significant threat to privacy-focused users.Keep yourself secure online with the best secure VPN providers of 2020 Source: Apple Apple Store online customers have spotted that Apple has removed the 'Reviews and Ratings' section from its website. It seems the change was made overnight between November 16-17. It's been done in the US, UK, and Australia, and doesn't look to be an error. An Apple Store online user has spotted that Apple has removed its 'Reviews and Ratings' section from all of the products on its Apple Store website. As reported by AppleInsider, the outlet was tipped off by a user who pointed out that the buyer review section was no longer available. Now, when you scroll down to the bottom of a product' page, you'll only find sections for 'Compatibility' and 'Questions & Answers.' Source: AppleInsider Not only that, the previous star rating that used to be visible right below a product's price has also disappeared. As the report notes this has been reported across multiple online store sites including the US, UK, and Australia, which certainly would suggest that this is not an error, but rather an intentional change. The report also mentions a video posted to YouTube by Fstoppers criticizing Apple and reading negative reviews from its website. The video, titled Apple Fanboys, Where is your God now? has garnered nearly 60,000 views. It seems there may have been some suggestion that this pushed Apple to make the change. However, a response like that would seemingly be far too reactionary, and not at all in keeping with Apple's character. It's more likely that the change was planned by Apple, however, there is no indication from reports as to why this may have occurred. It could be argued that the 'Ratings and Reviews' section had become a forum for many to vent their frustrations at certain Apple practices and features, perhaps not directly related to the product they had purchased. For example, The Verge points out that Apple's Lightning to 3.5mm headphone adapter had 735 one-star reviews. It wouldn't be a stretch to imagine that plenty of these are customers angry at the fact that Apple has removed the headphone jack from its iPhones, requiring customers to purchase a separate, extra device if they wish to have such capability. The only thing we know for certain is that for now when shopping on Apple's online store, you won't be able to see reviews or ratings on any Apple Store online products. Last Updated on July 12, 2021 Sitting on my dining room table, I currently have half a dozen projects in various states of doneness. Some involve viviisected computer parts, others will eventually be wearable and a few are just cool things I've ran across on the internet. I like doing things myself — I think the DIY bug is one of the best communicable diseases in the lifehack community.These eighty sites are the places I turn to when I'm trying to figure out how to accomplish any particular goal. Any time I'm facing a new project, I start searching for how-tos that will help me figure out how other people did similar things and how likely I am to finish the project with all ten fingers still intact. I've broken them up into a few different categories, just to help you narrow down what you might be looking for. Some are simply archives full of tutorials. Some are blogs that publish how-tos fairly regularly. Some are just great resource sites. But they all have provided me with the information necessary to carry through on a project. Every How-To They Can Get Their Hands OnThese ten sites are more than happy to host any how-to around. I've seen everything from computer hardware hacks to instructions for brewing beer on these sites. This is the place to start — you can narrow down your search as you get a better idea of your project.Become a Technophile in Ten Easy StepsEach of these sites focuses primarily on providing the hacks you need to make sure that you have the best hardware and software around. One word of warning: you might run across some obsolete answers to your questions in the archives. Software how-tos don't age as well as tips on building new furniture Habitat Hacks You Can Live WithIf you're ready to make your home a little more customized, these sites will walk you through projects ranging from building furniture to home theaters for beginners. Remember, when it comes to your landlord, begging forgiveness is probably easier than asking for permission.Frugality gurus and health nuts alike advocate making your own food. Very few of us have access to either Grandma or a professional chef willing to walk us through the steps of homemade food, though. It's time to turn to a few how-tos and recipes that can help us out. Sewing and Other 'Feminine Arts'It seems like most crafters are have two X chromosomes, but there's no reason to count out knitting just because you have a Y chromosome. Heck, even Rosey Grier, defensive linebacker for the LA Rams, knitted some nice scarves.Doing Business Your WayLooking for some instructions on getting your business going a little faster? These sites have all sorts of tips, how-tos and ideas for getting your business up to speed. Keep in mind, though, that not every business is the same. Different businesses have different needs when it comes to growing. Hack Your Wallet and What's In ItNo matter how you earn money, keeping those dollars in your hands can be a struggle. Plenty of sites offer tips, tricks and tutorials to help you do just that — beyond improving your earning power, these sites can help you keep what you already have.Not all projects have a clear end result. There are plenty of opportunities to improve how you approach new tasks, study for tests and generally use your brain. Personally, these projects are often my favorites: I don't need lots of tools to carry them out and I can often use them to help my approach to other projects entirely. There are millions of sites out on the web with tutorials, instructions and tips for just about every project you dream up — not necessarily a site that can tell you how to do what you have planned, but definitely one that can give you a starting point. These eighty sites are just that — a starting point. These are places worth looking when you have a specific project in mind, sites that can get you started on your plans. Oh, and there's one more that's worth checking: LifeHack. I'd be horribly remiss if I didn't mention this site: it's an amazing resource when you're trying to decide how to tackle a new project.Featured photo credit: Jo Szczepanska via unsplash.com Time—it's easily wasted in the pursuit of work or enjoyment. You can track your time with all kinds of applications, from Pomodoro timers to good, old-fashioned sand timers. You might want to track your time to stay productive, to help your kids do their homework, or just as a reminder to check the oven before dinner. Timers are everywhere, but if you're looking for a distraction-free, quick timer for your tasks, you could use a free online timer. Thousands of these exist, all with fairly similar features, but with some surprises to help you track your time. If you're looking for an online timer clock to use, here are a few options for you to try. Timerdoro The Pomodoro free online timer is a classic, designed as a way to clear through tasks in 25-minute cycles, with short breaks afterward. The imaginatively-named Timerdoro uses this approach, giving users a free online timer clock to track time in small, 25-minute slots. Alongside the 25-minute Pomodoro timer, you can switch to various other preset options, including 5-minute break timers or 2-minute quick task timers. You can also set your own times, with various audio signals available to alert you when the time is up. You can sign up for a free Timerdoro account, allowing you to save your common timers, or use it entirely for free without signing in. TomatoTimer Another Pomodoro-focused timer, TomatoTimer is a quick and free online timer for you to use for work, school, and more. The 25-minute timer is the default, but you can switch to 10 or 5-minute timers instead, or customize these times in the TomatoTimer settings area. TomatoTimer is simple to use, with buttons to start, stop, or reset the timers, and audio alerts once the timer ends. Keyboard shortcuts are also available, too, for a hands-free approach. If you're using Chrome or Firefox, you can set desktop notifications to alert you when a timer is up, although you can disable browser notifications if these become annoying later. No sign-in is required either, but you can check the TomatoTimer time log for a history of your previous timers, although these won't save indefinitely. Toggl Online Timer Toggl is a great time management tool for freelancers and businesses looking to track tasks and work, with mobile apps and extensions to allow you to take your timer anywhere. If you don't have a Toggl account, however, you can use the Toggl Online Timer in your browser for free. If simplicity is what you're looking for, Toggl Online Timer is all you're going to need—press Start to start the timer, Pause to pause it, or Reset to reset it. It couldn't be simpler, as this timer is the kind you'll want to save to your bookmarks for emergencies. Of course, if you like the Toggl experience, you can sign up and take full advantage of its time tracking features for free, although paid subscriptions with additional features are available. Pomofocus If you need a free online timer to keep you focused, then the Pomofocus timer could be what you need. It offers 25, 15, and 5-minute timers, including a task timer that lets you create multiple timers for longer projects. Pomofocus also offers a personal report, showing your daily, weekly, and monthly hours. If you need desktop notifications, you can enable these when you first start a timer. Settings are also available, allowing you to change the preset timer alerts, change sound volumes, as well as switch to a darker mode. If you want to save your settings, you can sign in to Pomofocus using your Google account. Timer Tab Many of the free online timer sites in this list are stable, long-term sites that do exactly what they say—time you until the timer ends. Timer Tab is no different, but with regular updates, new features, and performance improvements, its a tool that deserves consideration for your quick timer needs. Timer Tab is both timer and clock, allowing you to count down with timers that can be hourly, or by the minute or second. You can also set an alarm clock with Timer Tab, giving you an alert when the time is hit. If you want to count upwards, Timer Tab's stopwatch feature is perfect for this, too, allowing you to pause or reset the stopwatch whenever you like, making it a great online timer for kids homework. You can also set custom themes or customize your own themes for the site-all for free. Online-Stopwatch Fast and free, Online-Stopwatch has been around for years, originally as a Flash-based timer for your browser. Remade with HTML5 for a more modern audience, Online-Stopwatch continues to offer different timers for users, including an online timer for kids to use in the classroom. You can also use the Online-Stopwatch service to create your own timer, with themes and templates to customize it to suit your own requirements. Don't let its outdated appearance fool you, as Online-Stopwatch is a clear and simple timer that doesn't try to impress with bells and whistles. If you like the service, you can support its development with a premium subscription. Google Timer If you're aiming for simple, you can head straight to Google to set up a quick free online timer in your browser. Open up Google search and type timer to begin. The Google timer appears at the top of the search results, just above Online-Stopwatch (another recommendation in this list). Options to control the free online timer are simple—press Start, Stop, or Reset. You can also switch between Google's timer mode to go downwards, or switch to the stopwatch mode to count upwards. If you're looking for something simple, this is the only online timer clock that you'll probably need. Other, more advanced options are available in the search results below the timer (including some of those listed in this list). Saving Time Online With free online timers like these, you don't need to pay to keep your timings on track. Whether it's for work or play, these online timers can help you keep to a schedule or boost your productivity, but they remain simple and free for all types of users. More advanced time-tracking options, like Toggl, are available, however. If you're looking to track your daily tasks, few services can beat Trello or Evernote for freelancers or small businesses, however, with plenty of Trello tips for new and advanced users to try.
