Click to download the free sample Version e a sample download, consult the file made below for more information on crocodiles or, alternatively, you can download Our Euro Pack a complete worksheet to use in class or home Environment. All Crocodiles are reptiles that They live mostly in large tropical rivers. Like other reptiles, the crocodile is a cold-blooded animal. The physical characteristics of crocodile their good predators do. They are known for their capacity to hide their prey in plain sight and ambush. The crocodiles are fast distances on short both ground and in water as well. This helps in their predatory capacities. The crocodiles have sharp teeth and have the strongest bite of any animal around the world. Although the crocodile has a strong bite, the muscles that open their jaws are not so powerful and reasonably strong human could contain their jaw closed with naked hands. Crocodiles can survive long without food. When they eat, the crocodile has a variety of fish, birds and other animals. Most crocodiles live in tropical and lakes freshwater rivers, but some, like Australian jumps, even traveling and living in coastal salt water. Crocodiles Heat release through their mouths rather than through the sweat glands. The saltwater crocodile is the largest species of crocodile and can grow to be 7-15 feet and up to 1,200kg (2,600lb) in the weight. As alligators, crocodiles are part of the order *Á é crocodylia* é a, which is a group of reptiles that includes extinct birds and dinosaurs. In Florida, there are more than 1,000 American crocodiles, and this doesn't have larvae. American crocodiles are not only found in the south Florida, but also the Caribbean, southern Mexico and along the American central coast towards Venezuela. American crocodiles are much less aggressive than Nile and Australian crocodiles and are much more timid and lonely. January and February is the typical season of loves for a crocodile and the gestation period is about 2-3 months for egg incubation. A typical clutch dimension is around 35-50 crocodile eggs. The female crocodile will build a dirty nest near the Water a s edge in April or May. You will bury the eggs and keep your nest fiercely from other animals. When the eggs open crocodile in July or August the female will take her young by her for water. Unlike the crocodile, though, the crocodile will not continue to take care of her young. The most serious threats for crocodiles are the loss of their habitat due to human development, illegal killing by poachers, and collisions with animals.
